

Unreleased club records. One owner each.

How Signal Studio makes, measures, curates and licenses the records it sells — and what you receive when you buy one.

Records by Davin, made with the SignalGen engine. The golden rectangle above holds five records from the current catalog.

A store for records that have never been released.

Signal Studio sells finished, unreleased club records — tech house, bass house and minimal — to artists, DJs and labels who want to release them as their own. Each record is mastered, delivered as an Extended Mix and a Radio Edit, and licensed exclusively: it is sold once and then removed from the catalog for good.

The records come from Davin's studio, where the SignalGen engine builds complete arrangements and every result is measured against commercial references and judged by ear before it is offered for sale. This paper explains that process, the quality standard, the license and the way a sale works.

9 Originality and responsible use

Finishing records takes longer than making them.

For artists

Releasing regularly is what keeps an artist visible. A finished record that already sounds like the charts saves weeks between releases — and it is yours to edit, re-title and sign.

For DJs

A DJ with original records gets booked differently. An Extended Mix with a clean drum intro and outro is ready for the booth on day one.

For labels

Labels can fill a release schedule with records nobody else can license, with a certificate that proves exclusivity to distributors.

What makes it different

Exclusive by design

Every record is sold once. The store removes it the moment a payment clears, and refunds a second simultaneous payment automatically.

Finished, not a demo

Arranged, mixed and mastered to commercial loudness. You can release it the same day.

Measured against the charts

Each record is compared with current commercial releases in its genre before it is listed (section 4).

Judged by ear

Only the records that win the studio's own listening tests reach the store (section 5).

Two masters, a certificate and the right to release.

Extended Mix	The DJ version: a drum intro and outro of 16 bars for mixing, typically 4:30 to 5:45.
Radio Edit	The streaming version: enters 8 bars before the end of the intro and leaves 8 bars into the outro, typically 3:30 to 4:45.
Format	WAV, 44.1 kHz, 24-bit, stereo. No normalization, no dither in the 24-bit file.
Mastering	Finished to club loudness with a true-peak ceiling below -1 dBTP, so the file survives streaming encoders without clipping.
Metadata	Tempo, musical key with its Camelot code, genre and a short description for your release page.
Certificate	A license certificate in your name with a license number, the recording details and the full terms. Printable and saveable as PDF.
Rights	Exclusive, perpetual and worldwide. Release under any name or label, on any platform, with no royalties owed (section 6).

US\$ 59

One price for every record, both versions included.
Payment by card, Apple Pay or Google Pay through Stripe.
No account, no subscription.

An engine builds it. A producer decides.

SignalGen is the engine behind every record. It does not generate a finished audio file in one step; it builds a full Ableton Live project the way a producer would — parts, sounds, arrangement, mix — so every decision can be inspected and changed. The path from an empty session to a record in the store has six stages.

1 Form	A structure of about 150 bars taken from proven club arrangements: intro, groove, build, drop, break, second drop, outro. The drop can move a little to keep records from feeling identical.
2 Parts	Drums, bassline, chords, hooks, vocals and effects are written to the key and the progression. Something new happens at least every four bars.
3 Sound	Most sounds are synthesized from scratch; the rest are royalty-free licensed one-shots and loops. Roughly 60 % synthesis, 40 % licensed sounds.
4 Mix and master	Gain staging, panning, equalization, compression and mastering are done inside the project, ending at commercial loudness.
5 Measure	The rendered record is compared with commercial references in its genre (section 4). Records that drift too far are corrected or dropped.
6 Judge	The studio listens, rates and compares records head to head. The winners become the daily picks for the store (section 5).

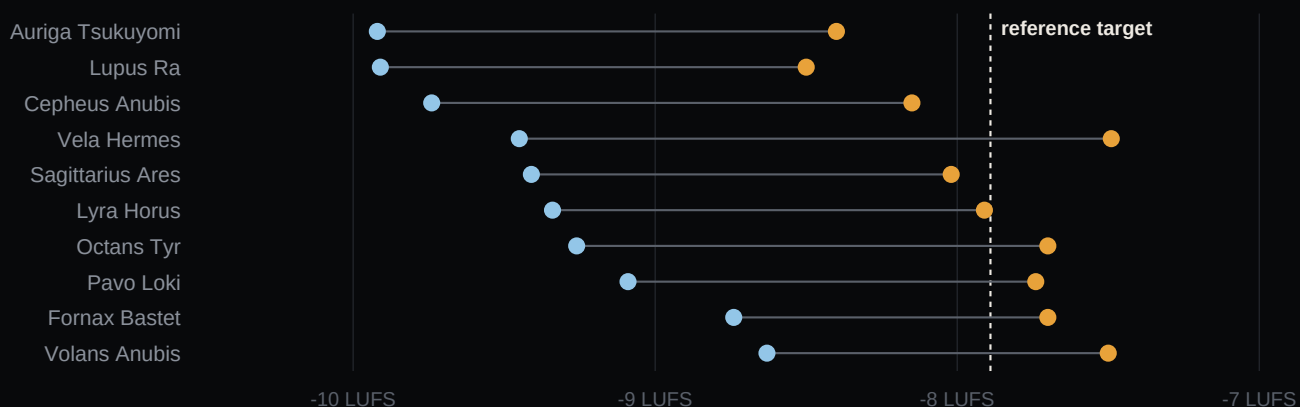

Measured against the charts.

The engine keeps a library of current commercial tech house releases — 17 today, 32 by the end of October. Each reference is measured as a whole and, after source separation, stem by stem: drums, bass, vocals and the rest. Every record is held to the same measurements before it can be listed.

Loudness	Integrated level and the loudest passages, measured to the broadcast standard ITU-R BS.1770.
Tonal balance	Level per frequency band, compared stem by stem — bass with bass, drums with drums.
Structure and energy	Where the energy rises and falls, how long builds and breaks last, how much space the arrangement leaves.
Surprise	How often something unexpected happens. Too little sounds like a loop; too much sounds like noise.

Loudness of the ten records in the catalog

Integrated loudness (ice) and loudest passage (amber) of each Extended Mix, against the target taken from the references (line).

All ten masters keep a true peak between -1.18 and -1.09 dBTP.

The engine proposes. People choose.

A record that passes the measurements is not automatically good. Taste decides the rest, and taste is human. Three layers of listening stand between the engine and the store.

1

The producer

Davin listens to new records daily and rates drums, bass, vocals, hook and the record as a whole. Comments become rules for the engine, so the same mistake is not made twice.

2

Blind duels

Two drops play back to back with no names. The studio picks the better one. Thousands of these choices train a model of the studio's taste that ranks every new record.

3

The audience

Visitors can vote in the same blind duels on the store's "Help us choose" page. Their votes count, at half the weight of the studio's.

Every day the five records with the highest predicted rating are published to the store, mastered, with their radio edits. Everything else stays in the studio.

Exclusive, perpetual, worldwide. Written in plain language.

Exclusive	The recording is sold once. It leaves the catalog at the moment of purchase and is never licensed to anyone else.
Release it	Release, distribute, stream, sell, perform, broadcast and synchronize it under any artist name or label, on any platform. No royalties are owed.
Change it	Rename it, edit it, remix it, add vocals. You own the master rights to what you release.
Cleared	Original synthesis and royalty-free licensed sounds only. No uncleared samples and no third-party recordings.
Credit	Optional. Nothing requires naming Davin, Signal Studio or SignalGen.
Not allowed	Reselling or redistributing the files themselves as a product — for example as ghost production, a sample pack or a stems pack.
Two buyers	If two payments for the same record complete at the same time, the first wins and the second is refunded in full.

Proof of license: the Stripe receipt, the purchase page and the certificate, which carries the licensee, the date, the license number and these terms.

Three steps, about two minutes.

1

Listen

Each record has a 30-second preview of its final drop. The player at the bottom of the store plays the catalog straight through.

2

License it

Choose “Buy exclusive license”, pay through Stripe. The record is reserved for the length of checkout and leaves the catalog when the payment clears.

3

Download

Your purchase page gives both WAV files and the certificate. Links last 7 days; reopen the page to renew them.

Behind the scenes

Payments

Stripe Checkout handles the card details; Signal Studio never sees them.

Reservation

An open checkout expires after about 30 minutes, which keeps abandoned carts from blocking a record.

Confirmation

A signed message from Stripe confirms each payment. Only then is the record marked as signed and the order stored.

Delivery

Download links are signed and time-limited, so a forwarded link stops working after the window closes.

Ten records available today.

Extended 5:42

Lupus Ra
128 BPM A (11B)
Tech House
Extended 4:34

The catalog changes every day: new records arrive at the evening publication and signed records leave. Covers are original artwork made for each record.

What the engine does, and what it never does.

Is a person involved?

Yes. Davin directs the engine, listens to every candidate and decides what is sold. The engine is a production tool, not an autonomous artist.

Are the references copied?

No. Reference releases are used as a measuring stick for loudness, balance, structure and energy. Their audio is never sampled and their melodies are never reused.

Are there AI vocals inside?

Vocals are built inside the project — synthesized or from royalty-free licensed material — and carry no watermark from an online generator.

Can distributors accept these records?

Yes. You hold an exclusive license with a certificate, the recording contains no uncleared material, and the masters meet streaming loudness and true-peak requirements.

Can I say I made it?

You can release it under your name. If your platform or label asks how a record was produced, answer honestly: it was licensed from Signal Studio.

What if something is wrong with my files?

Reply to your Stripe receipt. We replace faulty files, and refund when we cannot.
